

Tuberculosis (TB)

Categories : [Health Issues](#)

What is TB?

Tuberculosis (often called TB) is an airborne infection caused by bacterium mycobacterium tuberculosis that usually attacks the lungs, but can attack almost any part of the body. TB can be spread by coughing, sneezing, laughing or singing. People nearby may breathe in the bacteria and become infected. Repeated exposure to someone with TB disease is generally necessary for infection to take place. TB is usually spread between family members, close friends, and people who work or live together.

What are the Symptoms of TB?

A person with TB disease may have any, all or none of the following symptoms:

- A bad cough that lasts 3 weeks or longer
- Pain in the chest
- Coughing up blood
- Weakness or fatigue
- Weight loss
- Loss of appetite
- Chills
- Fever
- Night sweats

Testing for TB Infection

There are two kinds of tests that are used to detect TB bacteria in the body: the TB skin test (TST) and TB blood tests. If you have a positive reaction to either of these tests, you will be given other tests to see if you have latent TB infection or TB disease.

Tuberculosis Control Program at the Connecticut Department of Public Health:

<https://portal.ct.gov/DPH/Tuberculosis/Tuberculosis-Control-Program>

The Tuberculosis (TB) Control Program works to interrupt and prevent transmission of TB, prevent emergence of drug-resistant TB, and reduce and prevent death, disability, illness, emotional trauma, family disruption, and social stigma caused by TB.
